INTRODUCTION

In the age of social media, there are myriad options available for the publication of content. However, with the torrent of new content being poured into the internet every second, it is easy for a research article to get drowned in obscurity.

In today's era, if we want our article to stand out, we must employ the same marketing strategies that any other content on the internet uses to promote itself. It might seem daunting for an academic to invest time and effort into the promotion of content but, it is a fundamental skill that every new scientist should possess. After all, you can get recognition for your work only when it has a wide audience; and everyone sees the benefits of it.

The impact of research is proportionally dependent on the exposure it gets. The more people are made aware of the work, the more popularity and acceptance is plausible. The impact of scientific work depends on its attributes and can be seen in varying areas such as academic, environmental, social, economic, and cultural.

In this article, we have explored the most popular and reliable blueprints used to promote content on social media and further extrapolated those principles to favour scientific research. This tool kit consists of all the various modes of publishing and promoting scientific data on the most popular social media platforms used today.

It is noteworthy to remember that social media is like a constantly evolving organism. As technology and algorithms become more sophisticated over time, the same strategies might not be effective forever. However, the methods explored in this article are geared to render the best possible results based on currently available data and the way social media works at present. Just as a scientist constantly keep themselves up-to-date with the latest advances in their field, it is equally important to keep abreast with the changing trends and features on the social media platforms you hope to succeed on.

HOW TO MAKE A GOOD POST

1. CONTENT

For textual posts, blogs, or captions:

- Keep it crisp & concise.
- Use simple words that are readable & clear, making it easy to follow.
- Harness the power of white space – adding blank spaces between your paragraphs makes it much easier to read & provides structure to the post.
- Write using a combination of short, medium & long sentences to make it harmonious.
- The first two sentences need to be attention-grabbing. When a post comes on people's wall/timeline, only the first few sentences are highlighted & the rest is hidden. Thus, they need to generate enough curiosity in the viewer to wish to read & engage with the content.
- Personalize the content by writing in first person. This brings a human touch & avoids the tendency of cookie-cutter captions, giving an experience of connection to the viewers.
- Use relevant #hashtags to reach the interested audience.

For photo, video, or infographics:

- Use clear pictures taken from a good quality camera.
- Avoid blurred images or shakey & grainy videos.
- Use bright, light shades that are easy on the eyes & bold colors to highlight important parts in infographics.
- An appealing color scheme enhances the reader's experience and makes them more engaged with the content. People tend to pay more attention to things that are pleasant to look at.
- Use attractive & informative Thumbnails for your video content, which will generate curiosity in the viewers.
- Keep the customization that is native to the platform. E.g., on youtube, widescreen videography is the norm, so use it to give an enhanced user experience.

- For videos, try to include an interesting thumbnail which will grab the attention of the viewer. Motive should be to entice the audience into clicking on the video.

2. ADD VALUE

- Your post should address or gather information regarding people's problems.
- Add value to people's lives by providing solutions to them that are practicable & actionable. Know what your audience needs & cater to it.
- Share relevant work from different sources that will give you domain-specific expertise.
- Mention your personal journey, how you navigated through challenges in a story-telling format. This enables you to be a thought leader & people can use your experience to their benefit.
- Ask people to engage with your content by mentioning what they liked & disliked about it, by conducting polls, etc.

3. AVOID

- Offensive language & derogatory words. This can be reported & your profile may be banned or blocked.
- Extremely polarizing opinions. This can result in shadow banning on platforms which will significantly impact your reach.
- Excessive self-promotion or overly highlighting yourself. A good thumb rule would be to balance four informative posts that can help your audience or add value to their lives in some way & 1 promotional post.
- Impulsive posting. Maintaining a content strategy for scheduling posts will help immensely to build a great profile.

REMEMBER

HOW TO MAKE A GOOD POST

CONTENT

- Keep it crisp & concise.
- Harness the power of white space.
- Personalize the content by writing in first person.
- Use relevant #hashtags.
- Use clear pictures.
- An appealing color scheme.

VALUE

- Your post should address or gather information regarding people's problems.
- Add value to people's lives by providing solutions.
- Share relevant work from different sources that will give you domain-specific expertise.
- Mention your personal journey
- Ask people to engage with your content.

AVOID

- Offensive language & derogatory words.
- Polarizing opinions.
- Excessive self-promotion or overly highlighting yourself.
- Impulsive posting.

CHANNELS OF PROMOTIONS

There exist multiple mediums to promote your research work so that it can reach relevant people & organizations. They can be classified as: -

FORMAL / TRADITIONAL METHODS

Traditionally, the formal modes of exchanging and promoting scientific work have been through Scientific Journals, interpersonal networking with colleagues at scientific events and conferences, and people who share similar interests via word-of-mouth. While Scientific Journals remain the most widely accepted and credible mode of disseminating scientific information, online journals are gaining more popularity. We are seeing more and more print media going out of style as people rely heavily on their computers and the internet for most of the information. Platforms like PubMed and Scopus have made it incredibly easy for scientists to discover and collate information from sources across the world, and therefore, it is no longer enough just to have your work published in a reputed journal. Additional promotion needs to be done to make sure it stands out among the countless other publications, and your peers are able to find it more easily.

Conferences are a great way to interact with like-minded people, and they provide an excellent platform for networking and showcasing your work. Presentation of research at big events also increases a researcher's credibility among their peers.

INFORMAL / TRADITIONAL METHODS

An informal way that was traditionally used to promote scientific information to the general public is printing it in newspapers and magazines and broadcasting it over the radio. These modes, however, are on the decline as fewer people rely on print media these days to keep up with the news.

FORMAL / NEWER METHODS

ResearchGate

To promote your articles on Research Gate, you:-

- ✚ Require an institution email id to join, which ensures that all users are genuine researchers working with recognized institutes. ResearchGate provides
- ✚ Create an account to connect with other peers who share similar areas of interest.
- ✚ Keep your academic CV up-to-date.
- ✚ Post new abstracts to your profile.
- ✚ Send links to peers working on similar projects to help them with their work and encourage them to cite your paper in their literature.
- ✚ Build a relationship with others, regularly share their work, and cite their articles in your own work. It is always a two-way street.
- ✚ When people cite your work, reach out to them personally and thank them for the citation. This will create a mutual feeling of respect and encourage them to cite more of your work in the future.

ORCID

Orcid ID is a 16-digit unique identification identity that supports the explicit record of a researcher by ascribing a scholarly communication between the author and contributors. It is a non-profit organization available worldwide. In addition, a researcher can apply for grants, peer review activities, employment annex, credits, and other scholarly facilities.

Orcid Id Process

Exemplify work

Be discernible

Databases

Google Scholar profiles

This platform allows the researcher to display their academic publications. It enables the webpage to compute and update an author's citations automatically. Create a google scholar profile and link the google scholar profile with the ORCID id in the website section to obtain a wider reach.

LINKEDIN: THE SOCIAL NETWORK FOR PROFESSIONALS

LinkedIn is one of the world's largest social media networks for professionals. A complete LinkedIn profile could help you build & showcase your unique professional story that can open new avenues for you in the form of the right job, new internships, or for connecting & strengthening business relationships. It can also be used as an upskilling & certification platform to promote your strengths & increase your professional circle.

Adding relevant publications & your research work to your LinkedIn profile can prove to be a collaborative boon. It highlights your skills in authoring academic or instructional content, gives your professional accomplishments an edge of expertise, and invites the world to explore your written works.

To begin with, it is essential to create a robust profile. Keep an updated resume in hand before getting started, & actively update your profile as you upskill yourself. Frame your content in the direction that showcases your professional journey.

- **PRO TIP:** While editing your profile, you will notice that the 'Publication' section is located at the bottom of your page by default. Reposition this to the uppermost area of your profile, under 'Experiences.' This shall enhance the visibility of your articles to viewers & potential collaborators & thus, increase the likelihood of a visitor reading your article.

Harness the new features of this platform, such as the LinkedIn Professional Portfolio. This allows you to show your work with increased functionality through images, videos, documents, and presentations.

Go public with your account – 'Creator mode.' It allows you to create posts & showcase them on your profile, which is highly recommended to grow your audience & curate your profile.

Make sure to constantly connect, especially with your co-authors, to share your work publicly in relevant circles. Growing your connections will also give you a broader audience to share your content & increase your discoverability. One of the easiest ways would be to join affiliated scientific groups, to open up opportunities for partnerships. This will help you get in touch with the officials of the academia, funding agencies, policymakers, or even simply get your voice heard by a larger, interested audience.

HOW TO SHARE YOUR RESEARCH OR ARTICLES

PUBLICATION SECTION

In the 'Publication' section, fill in the appropriate date the text was published from the drop-down lists.

Add the website address in the 'Publication URL' field, where more information about this article is noted.

Add the link of the article below it.

In case you have authored a book, you may add the link of the book from Amazon for those interested.

If any of the authors/co-authors are a first degree LinkedIn connection, they can be tied to the publication in the 'Author' field.

FINAL STEP

The 'Description' field can be used to provide the details of the published article/book(s). You can even mention a short excerpt to generate interest of the readers.

The maximum character limit is 2,000 (approximately 300 words), so keep it clear & crisp.

HOW TO MAXIMIZE REACH

1. Engage with your work.
 - a. Every time your work receives a new citation, consider adding it.
 - b. Take note of the Altmetric score of your post. Use tags, hashtags, polls, etc.
 - c. Enlist links to positive media coverage for your books or articles.
 - d. By doing this each time, you will be engaging with your work, promoting traffic to your page & aiding the circulation of your content.
2. Understand the LinkedIn Algorithm.
 - a. The First 30 to 60 minutes are essential - quick engagement is needed to widen your reach to more people. Initially, only a handful of people can see your new posts. Depending on their engagement, the algorithm pushed it to a broader audience with relevant interests. Build organic reach by testing & measuring what works for you, by knowing when your audience is available & engaging the most with you
 - b. PROTIP: Ask people to comment their views about the article.
E.g., If you have provided five recommendations in the study, ask people what they think the 6th could be.

3. Keep the post personal & professional.
 - a. Studies show that people are more likely to engage with content that includes a human face or depicts emotion, as they naturally gravitate towards content they can relate to. Harness this to your benefit by creating posts that show photos of your team, or your actions (work in progress images), while you direct people to your work. Write in first person to capture the reader's attention, & pose questions that will draw the reader in to look for answers in your publication.
 - b. PROTIP: Ask effective questions. One way to engage with people on the post would be by asking people to express their views by voting through emojis – using the LinkedIn like/insightful/celebrate/support/etc., buttons to give different answers.
4. Connect with all your collaborators – this includes co-authors and publishers, editors, your research team, or even survey participants for feedback & promotional activities. Build a personal bond, engage with their content & tag relevant connections in your work if you know they'd be interested in it.
5. Follow experts, join groups & create a domain-specific scientific network. Include global partners for more exploratory, collaborative opportunities.
6. Create an ORCID & add it to your profile.

Your Open Researcher and Contributor ID (ORCID) on your webpage will ensure that you get the credit & due recognition for your works in a single international registry.
7. Repurpose your work. Write a small summary of your article & publish it as another post. This allows those who did not see your work previously the opportunity to engage with you. Make sure your work adds value to people's life. Know their challenges, & provide a solution-based approach to them.

Twitter

Twitter is a real-time informative center. Twitter can assist people to publicize their articles smoothly. However, at first, one has to set up a Twitter account. There are five initial steps that can help you reach a wider audience. It can be categorized into "PRISM" where P stands for people, R for Relation, I for inbound Traffic, S for subscribe, and M for Monetization. Figure.1. It is evident that before we jump into building traffic, the profile has to be unique and attractive. In fact, to let people know about oneself, connect with people of the same interest, and form a relationship with the followers. It is imperative to follow the right people or association.

Once the person has conquered the above steps, he/she is ready to plan a step further towards promotional activity. Figure.2. Start being active and scheduling the tweet wisely. A word limit of up to 280 characters restricts the content; hence, writing a clear and concise message is a must. In addition, Twitter is the only platform where formal and direct reach is plausible.

Using an eye-catching tweet either in a visual or text form is integral to stand apart from others. There are ways wherein a particular image, collage, video, or graphics can be explored according to the type of study. For instance, a case study can allure people by preoperative and post-operative pictures. In an analytical study, a statistic or a poll can be created to engage people. A compelling headline is used in a scientific study, whereas sharing results is advantageous in an experimental study. Besides, Spread the word of the published article along with a link to an article. It has to be either by tagging the journal, publisher (e.g., @tandonline), or anyone who might be curious to read the article. Provide an accurate topic description in a witty manner. Add a hashtag (e.g., #covidvaccine) for optimal reach, but no more than two because going overboard can clutter the information. Involve in Twitter conversation by likes, retweets, comments, or providing own perception, but including the person by the tag is mandatory. [1] Lastly, pin the new tweet to curate a viewer's impressions.

Tips and tricks for different study types

Analytical- Randomized control trial	Post the results
Cohort	A few lines from abstract/ key message
Case- control	Create poll or paste a picture from biostatistics finding
Descriptive- cross- sectional	A compelling headline
Case series/ case report	Preoperative and post-operative picture

Altmetric

It is imperative that the published work reach the right audience at the right time due to a broader social engagement. Altmetric score is one way to accumulate all the records and research papers from numerous online resources like Twitter, Facebook, and other social media. By doing this, we can trace the moment a paper is published. The researcher does not have to wait for citations or try engaging the public to gain some attention. One of the advantages of using Altmetric is that it renders standard for other researchers and can help in future research activity.

There are a few Altmetric tools Such as Altmetric Bookmarklet, Almetric badges, and Altmetric API. Once the work is published, all the information, such as tracking the viewers, downloads, and citations, will be available in a single platform for a researcher.

Colors of the donut

The colors of the Altmetric donut each represent a different source of attention:

The Colors of the Donut

- | | |
|---------------------------------|-------------------------------|
| ● Policy documents | ● Google+ |
| ● News | ● LinkedIn |
| ● Blogs | ● Reddit |
| ● Twitter | ● Research highlight platform |
| ● Post-publication peer-reviews | ● Q&A (Stack Overflow) |
| ● Facebook | ● Youtube |
| ● Sina Weibo | ● Pinterest |
| ● Syllabi | ● Patents |
| ● Wikipedia | |

The amount of each color in the donut will change depending on which [sources](#) a research output has received attention from:

INFORMAL / NEWER METHODS

Instagram

Instagram is one of the few social media platforms which allows content creation in a wide range of formats. As discussed, different algorithms control the ranking of each format, which means content in a single format will not be successful across all features. Effective data promotion requires content creation tailored explicitly to each feature, and creating such content from scratch individually can be overwhelming and time-consuming.

We have created a set of guidelines to optimize content creation and the type of content which can be disseminated in each format. The goal is to take the primary source material to be promoted, that is, the published article, and then create smaller pieces of content in specific ways to minimize the time needed for it. The following chart will provide an overview of the content creation and optimized posting methods.

TURNING ARTICLES INTO CONTENT

Pictures:

- Interesting cases, before/after comparison, instruments, results. E.g., Pictures from a case report where an aesthetic technique is demonstrated to compare the pre and post-operative scenarios.

Infographics:

- Pictographic representation of the data, which is easier to understand.
- Clearly depicts the information discussed in this section but presenting in a logical pictographic form.

Video (Short and Long):

- Operative procedure demonstrations.
- For non-experimental studies: Make videos of discussion and/or theoretical lectures.

Excerpts:

- The abstract of the published article as well as positive results, discussion, and other interesting points.

Talking points:

- Create points about the merits, demerits, limitations, and interesting points of the study and keep them handy.
- Will usually come up while discussing the topic on IG live or while interacting with others.

It is likely that not all study designs are well suited to the creation of each type of content, as seen from the above chart.

Experimental study designs are best suited for all the formats. They have enough data to produce good-quality images and video content.

On the other hand, **non-experimental study** designs are more limited. For example, in a survey, it would be unlikely that the author will generate a lot of relevant photographs.

In such a case, more emphasis should be given to the possible type of content and efforts should be made to improve its quality and appeal.

POSTING CONTENT TO SOCIAL MEDIA

Posts, Stories and Reels

- Focused on the **general demographic** of the platform.
- Most viewers who will see this content may not possess the subject expertise or interest in the field. It is essential to keep this content comprehensible for the layman. Avoid overly technical jargon, which may alienate the audience.

Instagram live and IGTV

- Suitable formats to target a **focused demographic**.
The audience of this content will be those interested in the subject and possess some expertise.
- These formats are ideal for content that goes into more detail and focuses on the scientific aspect of the work.

Stories

- Brief posts that exist for 24 hours and then disappear. Each story has a duration of about 10 seconds to be displayed.
- Ideal type of post here is time-sensitive announcements like a teaser for upcoming posts or sharing interesting facts.
- Entice the viewer to check out your channel for more information on the subject.

Feed posts:

- Most common type of content on Instagram.
- Ideally, you should aim to post 3-4 times in a day with still images related to the research.
Schematics, mind maps, infographics that show case the technical and theoretical aspect of the research.
- Images that show obvious benefits such as before and after images, pictures of lab equipment, microscope field images, in-vivo images showing either the procedure being performed or the completed treatment.
- Posts should be accompanied by a long caption that explains the picture in detail in an engaging way.
- Instagram records how long a viewer spends looking at a post. Aim to create posts that viewers will want to spend time reading.

These posts can also include videos, if possible, which might increase the viewing time of the post.

IGTV:

- Long videos from 15 minutes to over an hour. The type of content suited for this would be long videos in the form of demonstrations or lectures that go deep into the research subject.

Reels:

- Short 15 second videos, usually accompanied by a music playback for quick entertainment.
- Instagram is currently heavily promoting content creators to use this form.
- Geared towards entertainment rather than education. However, it can be used to draw attention to the channel itself rather than the material.
- Interesting reels that perhaps showcase comedic content relevant to the academic field will prompt viewers to be engaged and relate with the content.

Instagram Live:

- Instagram Live is a live streaming platform where the creator can stream video and interact with the audience in real-time.
- Ideal to hold live discussions about the topic.

An excellent way to do collaborative discussion with other experts in the field, enhancing the viewership and interest in the content.

Interaction:

- Tagging and commenting on other people's posts.
- Tactfully interacting with others' content, asking intriguing questions, and tagging influential experts in the field to your post can bring significant attention to the account posting it.

FAVORING THE ALGORITHM

There are three things that have been consistently proven to be favored by the algorithm. Those are Consistency, quality, and engagement.

Consistency:

- Post on a regular schedule. Post any new content at the same time at regular intervals.
- Study social media analytics data to determine when the audience is most active and post content at that time.
- Use online tools which help schedule posts. Using these enable one to spend a short time uploading and creating the posts, and the programs will publish the content at the scheduled time.

Quality:

- Instagram uses machine learning to determine the quality of the posts.
- The content which is of a poorer quality or does not get much "view time" from the audience is ranked lower
- Make the images eye-catching. The post's aim should be to grab the viewer's attention with a bold declaration and then provide interesting content that the viewer would like to know more about.

Engagement:

- Most crucial metric that the algorithm uses to measure how the audience has received the content.
- Engagement means the way the audience interacts with the posts. This includes viewing the post for a long time, sharing it in any form, commenting on it, and saving the post to a personal collection.

A good way to drive engagement is to create content that showcases its positive impact on the community and puts a spotlight on the *people* who are making that change possible.

It should be noted that it will always be the human element (the person doing the work) in a social environment rather than the work itself, which will be interacted with.

Your friends are more likely to congratulate you on a post that shows your work rather than a post that only shows the work as a dispirit entity. An excellent example of this is a project where a community study has been done to understand the effects of oral hygiene. This would be a fairly common topic, and if the post is

focused solely on the results and the study itself, very few people are likely to show interest. On the other hand, showcasing the work as a community outreach where the dentist conducting the study empowered the community by promoting oral hygiene is more likely to engage the people and garner attention. At the same time, you should never misrepresent your work for attention. It is okay to focus on an aspect that may not be the primary focus, but one should never fabricate circumstances unrelated to work.

Creators should try to make interactive content. It should either be engaging information that users would want to share with others, provide value addition that the viewer will want to save, and content that might spark a conversation such as asking viewers' opinions in the comments and having discussions about it. All these strategies will boost engagement of the posts and encourage the algorithm to rank the content high, thereby increasing its reach.

SPONSORED AD

Another option for increasing reach is to opt for sponsored ads on Instagram. You don't even need an Instagram account to run ads on Instagram as long as you have a Facebook account with the business profile active. Instagram ads allow you to sponsor posts and stories so they can be promoted to users who are not following you. The creator can customize the duration for which the ads will run and the reach they are targeting. The cost of the ads is determined based on the parameters selected. This method guarantees maximum reach of the content but has the drawback of being very expensive. Finally, the objective is to drive the audience from all of these channels towards the creator's profile, where they can find the link to the main portal where the article was published.

Business accounts with more than 10,000 followers also have the option to add website links to their stories. For those who have access to such accounts can also put-up stories and highlight which directly link back to the original article.

WHAT NOT TO DO!

1. Do not send the link to your article via direct messages. Instagram will consider this as spamming and may lead to shadow banning.
2. Do not post the same comment on multiple posts or make several comments on the same post. This seems similar to bot behavior and will cause your account to lose the "Trust Score."
3. Do not use words in captions or comments which have negative connotations related to racism, politics, oppression, and religion. While these are valid topics related to research, social media has become more sensitive towards such subjection, and posts that mention them in any way may not be as widely promoted.

Facebook

Youtube

Why YouTube for promotion?

It also presents data in an exciting way that can be used to expand one's knowledge and better understand the subject.

How can YouTube be used for promotion?

There are mainly two forms that can be used for promotion:

1. Live Videos
2. Pre-recorded Videos

Live videos include Youtube Live, either by collaborating with a famous YouTuber and promoting or conducting an interview with the researchers. The Pre-recorded videos can be put up either as long videos or short 30 secs videos.

The long videos give add-on benefits of creating thumbnails, splitting the video according to the viewer's interest, enabling us to develop videos in the form of series, and create an interesting hook dialogue or style to attract the viewers.

On the other hand, the short videos grab the viewer's attention and are preferred than the long videos. They are easier to make and can be made in innovative formats like animations and trending music. Additionally, they can also be used as a trailer or the main long video.

If the YouTube channel gets 1000 subscribers and 4000 watching hours, you are paid for the videos created. You can apply for the YouTube partner program and avail the benefits of ads promotion.

Clubhouse:

The social media platform isn't new to an audiobook or a podcast app on the app stores. Like plenty of other social media platforms, Clubhouse was one of the most popular apps that gained most of its popularity during the COVID – 19 pandemic. More people stayed in their houses and explored a life limited to their digital devices. Clubhouse can also be used as a tool for focus group discussions to improve qualitative approaches to certain issues.

Even though Clubhouse and other podcasts are the future of social media because of a more relaxed approach minimizing the need for other aesthetically pleasing arrangements thereby simplifying the user experience, popularizing research articles are still heavily dependent on Instagram and Facebook because of the inability to share URLs and indirect access to a person's personal messaging.

CLUBHOUSE IS INVITE-ONLY PRESENTLY

An envelope seen on the top of the page is where the invites can be found.

LIVE AUDIO ROOMS

This live audio app is a platform where people can enter any room and listen to speakers talk on a wide plethora of topics. The user can either take the stage to participate in an active conversation or listen as an audience member to a conversation with other people from all over the globe. When the live room ends, it then disappears and is erased completely.

The user interface is pretty simple to use which gives the user an option to start their own room in the homepage, with certain other features like notifications and a calendar where the user can be notified about future meetings or join an existing room by entering the name of the room in the search bar.

Apart from the creator of the room, there is an extra designation known as a "Moderator" of a room who can let an audience member on the stage join a conversation irrespective of whether they raised their hands or not. Additionally, a moderator can also mute an unmute member on the stage. In case of a scenario where authors of an article are trying to popularize an article through a room, it is recommended to appoint the others authors as moderators because the room would still be live in case of any network issues from the creator's side.

USING VOICE AS THE ONLY SOURCE OF COMMUNICATION

The users are offered a more casual approach while having their conversations, which helps in superior communication without needing a camera or any strict dress code. The decision to make it voice-only was made with the intention that this medium delivers more empathy while having tough and competitive conversations. The emotion conveyed through voice allows the user to make unique connections with others.

BASIC FUNCTIONS OF A ROOM

A room in Clubhouse basically works similar to a virtual conference/seminar hall. Rooms can be of 3 types.

Before starting a room, the creator of the room needs to give a brief description of the room which can be edited until the room is live.

The moderator can sometimes turn the "Raise hand" option when the presenters don't want to be interrupted in the middle of a meeting. The explore option on the homepage lets the user find people and clubs in which they may be interested. Following academically oriented clubs may help strengthen the publisher's reader circle and keep the article publicized among like-minded academicians and students. This is an efficient way of helping an article gain popularity. It also grants access to live chats that are based on the user's search algorithm.

COMMUNITY BUILDING AND NETWORKING

The user can click on someone's bio; a description can be seen in their bio if they have updated it. This could either be someone on the stage or someone from the audience. On the bottom of a person's profile, access to the person's Twitter, Facebook or Instagram accounts can be seen when updated by the user. This is extremely important because Clubhouse does not allow any private messaging on the app, making other social media apps even more important. Most networking that happens through Clubhouse takes place off-platform, indirectly, and mainly on Instagram and Facebook. Since Clubhouse allows for such exclusive and private conversations, it can be used as a digital marketing tool. It could potentially serve as an invaluable asset to promote published articles and studies among scholars and students belonging to a particular community, hence pushing the boundaries of academics even further.

Podcasts

A podcast is an episodic series of digital audio or video files that a user can download to listen to. Platforms that we could use for promotions

- Spotify
- Google Podcasts
- Soundcloud Podcast

PROMOTIONS

- ✚ Be a guest on famous shows.
- ✚ Share reviews and testimonials in your podcast advertisement.
- ✚ Ask people to subscribe to your podcast channel.
- ✚ Keep discussions on your research and make it sound interesting.
- ✚ Put podcast details on the front page of the website to grab attention.
- ✚ Mention one name of your subscribers in every episode of your podcast. They will likely share the podcast with their friends too.
- ✚ Embed a podcast player on individual posts or display a playlist player on a more general page about the podcast so people can listen on the website as well.
- ✚ Create an email list and let people know about new episodes.
- ✚ Have guests on your show
- ✚ Giveaway contest - ask people to answer or participate in the contest after they have subscribed and shared on other platforms.
- ✚ Create audiograms(Research topic) to share short clips from your show.

Thus, various avenues like these can be explored after your research journey. Happy promoting!
