

Cusps and Clues: An Insight to Evidence Based Dentistry

Protocol:

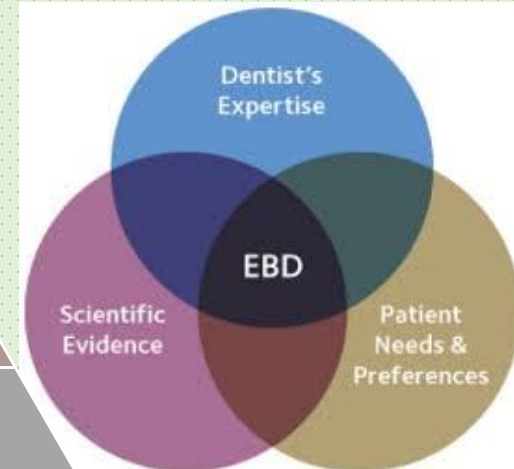

EBD involves a number of steps starting with the dentist reviewing each case and asking the question “What is best for the patient?”. The data collected over a vast number of cases forms the evidence in any pathology.

By studying the data received over the course of research enables us to determine the most optimum method of treatment of each individual pathology in the patient

Overview:

The purpose of EBD is to acquire an in depth knowledge of practices adopted by the practitioner and to determine the most beneficial method of treatment for the patient in each individual case

2. Evidence-Based Dentistry - An Introduction by Allan K. Hackshaw, Elizabeth A. Paul, Elizabeth S. Davenport

Conclusion:

In this rapidly evolving world, where health care is driven by innovation and technology, it becomes extremely important to determine which of these practices are the best way to treat our patients. Thus, EBD has donned an extremely crucial mantle as a tool internationally in every discipline of dentistry.

Cochrane Review:

Formerly known as the Cochrane collaboration is an international organisation with over 37000 volunteers across 130 countries that help organise medical research
